Title:- Regenerative Braking System

Duration:- 4 months

Description:- Regenerative braking means re-capturing the kinetic energy of the vehicle's motion and turning it into another type of energy. Commonly, this is done by converting kinetic energy into electricity and recharging the car's battery with it.

Regenerative braking systems use their electric motors to slow the car and generate electrical energy . Hybrid cars, where regenerative brakes are the most common, and electric cars can reverse the flow of power through their electric motors backwards to slow the car down. In one of those convenient engineering coincidences, electric generators are the same as electric motors.
